| sufficient animal evidence. The la inhalation exposure to powdered | k as a Group 2B carcinogen, for which there is inadequate human evidence, but<br>atter is based upon the development of lung tumors in rats receiving chronic<br>carbon black at levels that induce particle overload of the lung. However, there<br>a toner containing carbon black which demonstrated no association between<br>pment in rats. |

### **Others:**

Chronic effects:

Muhle et al. reported pulmonary response upon chronic inhalation exposure in rats to a toner enriched in respirable-sized particles compared to commercial toner. No pulmonary change was found at 1 mg/m<sup>3</sup> which is most relevant to potential human exposure. A minimal to mild degree of fibrosis was noted in 22% of the animals at 4 mg/m<sup>3</sup>, and a mild to moderate degree of fibrosis was observed in 92% of the animals at 16 mg/m<sup>3</sup>. These findings are attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lung for a prolonged interval.

# SECTION 13 DISPOSAL CONSIDERATIONS

### Method of Disposal:

DO NOT put toner or toner container into fire; heated toner may cause severe burns. DO NOT shred a toner container, unless dust-explosion preventing measures are taken. Finely dispersed particles form explosive mixtures in air. Disposal should be subject to federal, state and local laws.
